

# neurological

The neurological patient is an excellent candidate for dynamic splinting and thus, Dynasplint® Systems. The spring-loaded tension system safely accommodates a patient's tone by moving with the patient during episodes of resistance or spasms.

When tone is challenged with a consistent and even force, the muscle will fatigue and the patient will relax. This allows the patient to return to their end range to resume the low-load, prolonged-duration stretch (LLPS). By delivering a daily program of range of motion (ROM) with tone inhibiting therapy, Dynasplint Systems can both reduce and prevent future contractures.

## features and benefits—

- LLPS (Low-Load, Prolonged-Duration Stretch) technology has been proven to successfully treat joint stiffness and limited range of motion
- Early application can reduce time and cost associated with range of motion rehabilitation
- Simple, adjustable and reproducible bilateral tensioning system
- Reimbursable through most insurances
- Biomechanically correct
- Comfortable and worn at rest
- Each Dynasplint System is recycled to reduce waste and help the environment
- A Dynasplint sales consultant will fit your patients and oversee their treatment to ensure the best possible results
- Over a half-million patients have been successfully treated with Dynasplint Systems
- Conveniently labeled, easy to use and online patient friendly video instructions
- Available for adult, pediatric and infant patients

## common diagnoses

Traumatic brain injury (TBI) | Cerebral vascular accident (CVA)

Spinal cord injury | Cerebral palsy (CP) | Multiple Sclerosis (MS)

Muscular Dystrophy (MD) | Other central nervous system diseases or disorders
